Alta Vista Golf Course and Country Club

Background

Alta Vista is the most prestigious Golf Course and Country Club in Cebu area. The IP cams are installed around the Golf course for monitoring, surveillance, and public viewing purpose when there is a tournament.

Solutions

In this project, GKB proposed GKB D01 for indoor and D6122 for outdoor. Each IP camera was equipped with 1 * 16G micro SD card for internal recording. As a result, there was no need to host a NVR doing central recording. Users then could use GKB free provided www.cloud-nvr.com and Viewer11 Software to remotely access the IP cam and playback micro SD card. The cloud platform allowed the Club owner to use IE browser to access all IP cams by key in his user name and password in GKB Cloud platform. There was no need to enter IP address or DDNS for each IP cam.

The Viewer11 software also allowed the owner to periodically download the video from micro SD card for back up. The downloaded video could be converted into AVI format automatically; as a result, it was playable at any AVI supported player.

GKB also supplied Bserver (known as Relay Server) to support certain IP cameras for public viewing when there was a tournament. The Club expected many users to access for game watching although the IP cam would not be able to support. The Bserver was deployed and only required one video stream from the IP cam to the server. When public users logged in, public users actually logged to the Bserver for video. Of course, there was no need for public users to enter Bserver IP or DDNS. Public users only open web browser and key in URL, game video video was automatically sent from Bserver.

Benefits

GKB Diplomat provides the most economical and user friendly in this project. The owner does not need to invest a standalone NVR for central recording because the video is saved in the micro SD card in each IP camera. When there is a tournament, the owner does not need to invest in bandwidth temporary for public viewing purpose.
